

CHAPTER SIX

# Appendices

APPENDIX 6.1

*Seed Characteristics of Common Conifers of the Pacific Northwest*

<i>Common name</i>	<i>Scientific name</i>	<i>Cone cycle (years)</i>	<i>Ounces of seeds per bushel of cones</i>	<i>Seeds per pound</i>	<i>Stratification (days)</i>
<b>Firs</b>					
Pacific silver fir	<i>Abies amabilis</i>	3-6	48	12,000	28
Concolor fir	<i>A. concolor</i>	2-4	17-32	11,000	28-60
Grand fir	<i>A. grandis</i>	2-3	24-32	19,000	21-42
Subalpine fir	<i>A. lasiocarpa</i>	2-4	22	34,000	28-42
California red fir	<i>A. magnifica</i>	2-3	18	7,000	28-42
Noble fir	<i>A. procera</i>	3-6	22-46	13,500	21-42
<b>Larches</b>					
Subalpine larch	<i>Larix lyallii</i>	1-10	-	142,000	28
Western larch (tamarack)	<i>L. occidentalis</i>	1-10	8	137,000	28
<b>Spruces</b>					
Brewer spruce	<i>Picea breweriana</i>	-	-	61,000	0-28
Engelmann spruce	<i>P. engelmannii</i>	2-3	6-16	135,000	0-28
Colorado (blue) spruce	<i>P. pungens</i>	1-3	12-20	106,000	0-28
Sitka spruce	<i>P. sitchensis</i>	3-4	6-20	210,000	0
<b>Pines</b>					
Whitebark pine	<i>Pinus albicaulis</i>	3-5	-	2,600	120-180
Bristlecone pine	<i>P. aristata</i>	1-2	17	18,000	0-30
Knobcone pine	<i>P. attenuata</i>	1	2	25,000	60
Foxtail pine	<i>P. balfouriana</i>	5-6	-	17,000	90-120
Shore pine (coastal)	<i>P. contorta</i> var. <i>contorta</i>	1	8-19	135,000	0-30
Lodgepole pine (interior)	<i>P. contorta</i> var. <i>latifolia</i>	1	3-13	94,000	0-30
Pinyon pine	<i>P. edulis</i>	2-5	52	1,900	0-60
Limber pine	<i>P. flexilis</i>	2-4	-	4,900	21-90
Jeffrey pine	<i>P. jeffreyi</i>	2-4	16-32	3,700	0-60
Sugar pine	<i>P. lambertiana</i>	3-5	24-32	2,100	60-120
Single-leaf pinyon	<i>P. monophylla</i>	1-2	27-75	1,110	28-90
Western white pine	<i>P. monticola</i>	3-7	5-13	27,000	30-150
Ponderosa pine	<i>P. ponderosa</i>	2-5	9-32	12,000	30-60

<i>Common name</i>	<i>Scientific name</i>	<i>Cone cycle (years)</i>	<i>Ounces of seeds per bushel of cones</i>	<i>Seeds per pound</i>	<i>Stratification (days)</i>
<b>Douglas-firs</b>					
Rocky Mountain Douglas-fir	<i>Pseudotsuga menziesii</i> var. <i>glauca</i>	2-11	8-13	44,000	21-42
Coast Douglas-fir	<i>P. menziesii</i> var. <i>menziesii</i>	3-11	4-13	39,000	14-28
<b>Yew</b>					
Pacific yew	<i>Taxus brevifolia</i>	-	-	15,500	*
<b>Cedars</b>					
Western redcedar	<i>Thuja plicata</i>	3-4	12	414,000	0-42
Incense-cedar	<i>Libocedrus decurrens</i>	-	16-48	15,000	28-60
<b>Hemlocks</b>					
Western hemlock	<i>Tsuga heterophylla</i>	2-8	-	260,000	21-90
Mountain hemlock	<i>T. mertensiana</i>	1-5	-	114,000	90
<i>Pounds of seeds per 100 pounds of fruits or cones</i>					
<b>White-cedars</b>					
Port-orford-cedar	<i>Chamaecyparis lawsoniana</i>	-	20	210,000	0-14
Alaska yellow-cedar	<i>C. nootkatensis</i>	-	-	108,000	30-90
<b>Junipers</b>					
California juniper	<i>Juniperus californica</i>	-	-	-	*
Common juniper	<i>J. communis</i>	-	16	36,000	*
Western juniper	<i>J. occidentalis</i>	-	20	12,000	*
Utah juniper	<i>J. osteosperma</i>	2	25	5,000	*
Rocky Mountain juniper	<i>J. scopularum</i>	2-5	11-28	27,000	*

## APPENDIX 6.2

*Intensive Fertilization for Bareroot Seedlings—An Introduction*

The percentage of N, P, and K in a bag of fertilizer is always given in the order of N:P:K. Well, that's not quite right. Because of some archaic convention, the percentages of P and K are really given as percentages of the oxides of P and K:  $P_2O_5$  and  $K_2O$ . Therefore, a bag of 8:10:3 has 8% N, 10%  $P_2O_5$ , and 3%  $K_2O$  by weight. To convert  $P_2O_5$  to P, you'll need to multiply the percentage of  $P_2O_5$  by 0.437. Similarly, to convert  $K_2O$  to K, multiply  $K_2O$  by 0.83. This process may sound confusing, but let's work through an example using this equation:

Convert that to P:  
 $0.18 \times 0.437 = 0.08$  pounds of P were applied to the nursery bed.

You may convert that back to a pounds-per-acre rate by dividing it by 180 (that gives you pounds of P per square foot) and then multiplying by 43,560:

$0.08 \div 180 = 0.00044$  and  
 $0.00044 \times 43,560 = 19$  pounds of P per acre.

Similarly, to determine how much K was applied, take the 1.8 pounds of fertilizer and multiply it by 0.03 (3%

their choices for fertilizers usually include multiple nutrients per fertilizer formulations (for example, 9:1:1 or 0:3:1). This means more arithmetic for organic farmers because they may have to do some "tinkering" with their formulations and application amounts to achieve recommended fertilizer rates.

Regardless of your situation, right before the first growing season, plan on incorporating P and K into your nursery beds. If you have a good sandy soil, add some N as well. If your soil is too acidic (pH under 5) or too basic (pH over 6) for conifer seedlings, this is

$$\frac{\text{Amount of Nutrient Required (Pounds per Acre)}}{\% \text{ Nutrient within Fertilizer}} \times \frac{\text{Square Feet Needing Fertilizer}}{43,560 \text{ Square Feet per Acre}} = \text{Pounds of Fertilizer Needed}$$

Let's say we want to use some 8:10:3 fertilizer, we want to apply 35 pounds of N per acre, and our nursery bed is 4 feet wide and 45 feet long (180 square feet).

First, divide 35 pounds of N by the percentage of N in the fertilizer (0.08):  
 $35 \div 0.08 = 438$  pounds of fertilizer per acre to get 35 pounds of N per acre.

Divide the 438 pounds of fertilizer by 43,560 (the number of square feet in an acre):

$438 \div 43,560 = 0.01$  pounds of fertilizer per square foot.

Multiply 0.01 pounds of fertilizer per square foot by the 180 square feet in the nursery bed:

$0.01 \times 180 = 1.8$  pounds of fertilizer should be applied to the nursery bed.

Okay, how much P and K were applied at the same time?

For P, multiply the 1.8 pounds of fertilizer by 0.1 (remember there's 10%  $P_2O_5$  in the fertilizer):

$1.8 \times 0.1 = 0.18$  pounds of  $P_2O_5$  were also applied to the nursery bed.

$K_2O$  in the fertilizer); we applied 0.05 pounds of  $K_2O$ . Convert that to K by multiplying 0.05 pounds of  $K_2O$  by 0.83; 0.04 pounds of K. Like P, you can convert back to pounds of K per acre by dividing by 180 and multiplying by 43,560; we applied 9.7 pounds of K per acre.

In commercial bareroot nurseries, commonly used fertilizers are ammonium phosphate (11:55:0), ammonium nitrate (33:0:0), ammonium sulfate (21:0:0), calcium superphosphate (0:20:0), triple superphosphate (0:45:0), potassium sulfate (0:0:50). In general, if you have a soil with pH less than 6.0, your fertilizers of choice would be ammonium phosphate and ammonium nitrate. These fertilizers help maintain your pH around 5.0 to 6.0. However, if your soil pH is on the high side (over 6.0) use ammonium sulfate.

One advantage of using single element fertilizers is the ease of manipulating the amounts of each nutrient applied; only one nutrient is in each fertilizer formulation. Commercial operators have the luxury of using a particular fertilizer to apply a particular nutrient. Novice growers who wish to use an organic alternative may find that

also the time to add lime to bring the pH back up or sulfur to lower pH. Use a whirly-bird-type spreader or drop-type spreader to apply fertilizer. You may have to mix it with sand to have enough material to fill your spreader and ensure an even application. Make sure it's applied evenly! Spade or rototill the fertilizer into the soil. Once your crop is growing, you'll need to topdress N and K over the top of your seedlings. If damping-off is a problem, avoid early applications of N during the first season.

## APPENDIX 6.2.1

*Intensive Bareroot Fertilization for Soil With pH Under 6.0*

Year	Timing	Nutrient	Number of applications	Rate (pounds per acre)	Fertilizer (see footnote)	Ounces of fertilizer per 100 square feet
First Season	Pre-sow	N	1	35	11:55:0 <sup>A</sup>	12
		P	1	120	0:20:0	18
		K	1	45	0:0:62	3
	Top-dress	N	4 (mid-June, early and mid-July, & late September)	20	33:0:0	2
		K	1 (mid-summer)	20	0:0:62	1.5
Second Season	Top-dress	N	1 (March)	35	33:0:0	3.5
		K	1 (March)	20	0:0:62	1.5
		N	4 (May, June, July, late September)	20	33:0:0	2
		K	2 (early and mid-summer)	20	0:0:62	1.5
Transplants	Pre-plant	P	1	60	0:20:0	25
		K	1	45	0:0:62	1.5
	Top-dress	N	4 (May, June, July, late September)	40	33:0:0	4
		K	2 (early and mid-summer)	20	0:0:62	1.5

## Fertilizers:

11:55:0 Ammonium phosphate  
 33:0:0 Ammonium nitrate  
 0:20:0 Calcium superphosphate  
 0:0:62 Potassium chloride

<sup>A</sup> Note the application of 12 oz. of 11:55:0 supplies the necessary rate of N (35 lbs. per acre) and 78 lbs. of the suggested 120 lbs. of P per acre. Therefore, the amount of 0:20:0 supplies only 42 lbs. of P per acre (the difference between 120 and 78).

## APPENDIX 6.2.2

*Intensive Bareroot Fertilization for Soil With pH over 6.0*

Year	Timing	Nutrient	Number of applications	Rate (pounds per acre)	Fertilizer (see footnote)	Ounces of fertilizer per 100 square feet
First Season	Pre-sow	N	1	35	11:55:0 <sup>A</sup>	12
		P	1	120	0:45:0	8
		K	1	45	0:0:50	4
	Top-dress	N	4 (mid-June, early and mid-July, & late September)	20	21:0:0	3.5
		K	1 (mid-summer)	20	0:0:50	2
Second Season	Top-dress	N	1 (March)	35	21:0:0	6
		K	1 (March)	20	0:0:50	2
		N	4 (May, June, July, late September)	20	21:0:0	3.5
		K	2 (early and mid-summer)	20	0:0:50	2
		K	2 (early and mid-summer)	20	0:0:50	2
Transplants	Pre-plant	P	1	60	0:45	11
		K	1	45	0:0:50	2
	Top-dress	N	4 (May, June, July, late September)	40	21:0:0	7
		K	2 (early and mid-summer)	20	0:0:50	2
		K	2 (early and mid-summer)	20	0:0:50	2

## Fertilizers:

11:55:0 Ammonium phosphate

21:0:0 Ammonium sulfate

0:45:0 Triple superphosphate

0:0:50 Potassium sulfate

<sup>A</sup> Note the application of 12 oz. of 11:55:0 supplies the necessary amount of N (35 lbs. per acre) and 78 lbs. of the suggested 120 lbs. of P per acre. Therefore, the amount of 0:45:0 supplies only 42 lbs. of P per acre (the difference between 120 and 78).

Adapted from: van den Driessche, R. 1984. Soil Fertility in Forest Nurseries. Pages 63-74 in Duryea, M.L.; Landis, T.D. (eds.) Forest Nursery Manual: Production of Bareroot Seedlings. Martinus Nijhoff, Dr. W. Junk Publishers, The Hague/Boston/Lancaster, for Forest Research Laboratory, Oregon State University, Corvallis. 386 p. (see Appendix 6.6).

## APPENDIX 6.2.3

*Organic Fertilization of Bareroot Seedlings*

Year	Timing	Nutrient	Number of applications	Rate (pounds per acre)	Fertilizer (see footnote)	Ounces of fertilizer per 100 square feet
First Season	Pre-sow	N	1	35	9:1:1 <sup>A</sup>	14
		P	1	120	0:7:0	98
		K	1	45	0:3:1	58
	Top-dress	N	4 (mid-June, early and mid-July, & late September)	20	9:1:1 <sup>B</sup>	8
		K	1 (mid-summer)	20	0:0:7	8
Second Season	Top-dress	N	1 (March)	35	9:1:1 <sup>C</sup>	14
		K	1 (March)	20		
		N	4 (May, June, July, late September)	20	9:1:1	8
		K	2 (early and mid-summer)	20	0:0:7	10
Transplants	Pre-plant	P	1	60	0:3:1 <sup>D</sup>	168
		K	1	45	0:0:7	4
	Top-dress	N	4 (May, June, July, late September)	40	9:1:1 <sup>E</sup>	16
		K	2 (early and mid-summer)	20	0:0:7	8

## Fertilizers:

9:1:1	Ocean Fresh Fish Powder
0:7:0	Budswel
0:3:1	Earth Juice Bloom
0:0:7	Greensand

<sup>A</sup> Applying 14 oz. of 9:1:1 supplies 34 lbs. of N, 16 lbs. of P, and 32 lbs. of K per acre. Applying 58 oz. of 0:3:1 supplies the remaining 13 lbs. of K (45 lbs. total) and 21 more lbs. of P. Since we've only applied 37 lbs. of P, apply 98 oz. of 0:7:0 to supply the final 82 lbs. of P suggested (120 lbs. total).

<sup>B</sup> Four applications of 9:1:1 also supply 7.2 lbs. of K (1.8 lbs. per application). Therefore, we only need 8 oz. of 0:0:7 (12.6 lbs. of K) to achieve the suggested 20 lbs. of K.

<sup>C</sup> Applying 14 oz. of 9:1:1 supplies 34 lbs. of N and 32 lbs. of K per acre, which also satisfies our K requirement.

<sup>D</sup> Applying 168 oz. of 0:3:1 provides 60 lbs. of P and 38 lbs. of K, so an additional 4 oz. of 0:0:7 supplies 7 lbs. of K to bring the total to the recommended rate of 45 lbs.

<sup>E</sup> Four applications of 9:1:1 also supply 14.4 lbs. of K (3.6 lbs. per application). Therefore, we only need 2 applications of 8 oz. of 0:0:7 (12.6 lbs. of K each application) to achieve the suggested 40 lbs. of K.

Adapted from: van den Driessche, R. 1984. Soil Fertility in Forest Nurseries. Pages 63-74 in Duryea, M.L.; Landis, T.D. (eds.) Forest Nursery Manual: Production of Bareroot Seedlings. Martinus Nijhoff, Dr. W. Junk Publishers, The Hague/Boston/Lancaster, for Forest Research Laboratory, Oregon State University, Corvallis. 386 p. (see Appendix 6.6).

## APPENDIX 6.3

*Calculating the Number of Seeds to Sow per Container Using a Hand-held Calculator*

The technique is based on the concept that a seed either grows or it doesn't (binomial probability). If "X" equals the probability of a seed germinating and "Y" equals the probability of it failing to germinate, a binomial expansion can be constructed that includes all possible occurrences. The following example shows the possibilities when 2 seeds are sown per container:

$$(X + Y)^2 = X^2 + 2XY + Y^2$$

where:  $X^2$  = the probability of both seeds germinating

$2XY$  = the probability of only one germinating

$Y^2$  = the probability of neither seed germinating

So, as long as germination test data are known, the proper number of seeds to sow per container can be easily determined by entering the "germination failure" on a hand-held calculator with a universal power key ( $Y^X$ ,  $X^Y$ ,  $x^y$ ,

example, a seedlot with 78% germination has a 22% failure score.

You can see that the calculation becomes a "law of diminishing returns," and the best number of seeds to sow will depend on seed availability,

Seeds per container	Percentage of Empty Containers	
	Using $Y^X$ key	Using repeated multiplication
1	$(0.22)^1 = 0.22 = 22\%$	$0.22 = 22\%$
2	$(0.22)^2 = 0.0484 = 4.8\%$	$0.22 \times 0.22 = 0.0484 = 4.8\%$
3	$(0.22)^3 = 0.0106 = 1.1\%$	$0.22 \times 0.22 \times 0.22 = 0.0106 = 1.1\%$
4	$(0.22)^4 = 0.0023 = 0.2\%$	$0.22 \times 0.22 \times 0.22 \times 0.22 = 0.0023 = 0.2\%$

or something similar). The procedure consists of keying-in the decimal equivalent of the germination failure, pushing the universal power key, entering the number of seeds you might sow, and finally pushing the "equals" key. If your calculator doesn't have a universal power key, then just use repeated multiplication. In this

seed cost, cost of thinning, and the reliability of the germination test. In this example, most nurseries would be satisfied with sowing 2 to 3 seeds per container.

Source: Schwartz, M. 1993. Germination math: calculating the number of seeds necessary per cavity for a given number of live seedlings. *Tree Planters' Notes* 44(1):19-20.

*Calculating Parts Per Million and More Intensive Fertilization for Container Seedlings*

If you use any other fertilizers than the ones listed in Table 3.7, you'll need to determine how much fertilizer to mix in a volume of water to get the suggested ppm. Before we calculate ppm, let's first review fertilizer in general. As discussed for bareroot seedlings, the percentage of N, P, and K in a bag of fertilizer is always given in the order of N:P:K. And as was the case for bareroot seedlings, that's not quite right. The percentages of P and K are really given as the percentages of the oxides of P and K:  $P_2O_5$  and  $K_2O$ . Therefore, a bag of 30:10:10 has 30% N, 10%  $P_2O_5$ , and 10%  $K_2O$  by weight. To convert  $P_2O_5$  to P, you'll need to multiply the percentage of  $P_2O_5$  by 0.437. Similarly, to convert  $K_2O$  to K, multiply  $K_2O$  by 0.83.

Fortunately, for fertilization of container seedlings, more interest is on the rate of N. Many professional growers fertilize their crops with rates expressed in "some weight of fertilizer mixed in some volume of water" (ounces per 100 gallons, or pounds per 1,000 gallons). Some growers use some weight of N per volume of water. Finally, some growers fertilize using parts per million (ppm) or even milligrams of a nutrient per volume of water, both of which are just a more

refined version of "some weight of fertilizer mixed in some volume of water."

Calculating ppm's isn't really that difficult. A good rule of thumb is that one ounce of granular fertilizer in 100 gallons of water equals about 75 ppm of fertilizer. If your fertilizer is 30% N, then the ppm N in that solution is  $75 \times 0.3 = 22.5$  ppm N.

If you wanted 135 ppm N, you would have to divide 135 ppm N by the percentage of N in the fertilizer (30%) and divide that by 75:  $135 \text{ ppm} \div 0.3 \div 75 = 6$  ounces of fertilizer in 100 gallons.

If your fertilizer is 10%  $P_2O_5$ , then the ppm  $P_2O_5$  when you mix 1 ounce of fertilizer in 100 gallons of water is  $75 \times 0.1 = 7.5$  ppm  $P_2O_5$ . Remember to multiply 7.5 by 0.437 to convert  $P_2O_5$  to P ( $7.5 \times 0.437 = 3$  ppm P) and multiply 7.5 by 0.83 to convert  $K_2O$  to K ( $7.5 \times 0.83 = 6$  ppm K).

Some professional growers strictly use premixed fertilizers (like Peters Conifer Grower®), some use a combination of premixed and custom-mixed fertilizers, and some only used custom-mixed. The discrepancy usually depends on the background of the grower. Growers using custom-mixed fertilizer feel they have better control

over the growth of their seedlings, and can manipulate fertilizers to achieve particular growth responses in the crop. Customized fertilizers blend the "science" of growing seedlings with the "art" of growing seedlings, and usually experience is key. Most growers like to add calcium to their fertilizers (not found in Miracid® or Miracle-Gro®) to promote stem diameter development in their seedlings. Some growers like to reduce the rate of N while maintaining high levels of K to promote bud initiation and hardening; raising K levels can be easily done with a custom-mixed fertilizer. Commonly used fertilizers for growing container seedlings can be found in Table 6.1.

As mentioned earlier, the actual rates necessary vary from locale to locale, and the following example in Appendix 6.4.1 shows the tremendous variability found among three nurseries in the northern Rocky Mountains in regard to how they fertilize a crop of ponderosa pine seedlings. Amazingly, all four nurseries grow excellent seedlings that thrive once outplanted. So go ahead, experiment! Keep detailed notes so you can develop your own "art" in seedling production.

TABLE 6.1

*Soluble fertilizer chemicals that provide macronutrients for custom fertilizer solutions for container seedlings.*

Compound	Chemical formula	% of Nutrient supplied						
		NH <sub>4</sub> -N	NO <sub>3</sub> -N	P	K	Ca	Mg	S
Ammonium nitrate	NH <sub>4</sub> NO <sub>3</sub>	17	17	-	-	-	-	-

APPENDIX 6.4.1

*Fertilization of a Container Crop of Ponderosa Pine*

Ratios of N:P:K:Ca (ppm) applied to ponderosa pine crops up to the time of bud initiation at four nurseries in the northern Rocky Mountains. Stock solution recipes for these ppm rates are provided below as amounts of fertilizer per 100 gallons of water. See Appendix 6.4 and Table 6.1 for fertilizer abbreviations.

Nursery	Weeks after sowing									
	2	3	4	5	6	7 to 9	10	11 to 12	13

## APPENDIX 6.6

*Beyond the Basics—More References*

Looking for more information? There are many excellent publications dealing with nursery management. The following publications contain good information on growing seedlings. If you plan on developing your hobby into a business, these publications should certainly be on your shelf.

***The Container Tree Nursery Manual***

Consisting of seven volumes, this USDA Forest Service manual contains all of the state-of-the-art information for growing seedlings. Although it contains technical information, the manuals are well written for both the professional and lay-person alike. As of 1998, only the first 5 volumes have been published:

1. Nursery Planning, Development, and Management
2. Containers and Growing Media
3. Atmospheric Environment
4. Seedling Nutrition and Irrigation
5. The Biological Component: Nursery Pests and Mycorrhizae
6. Seedling Propagation (expected 1999)
7. Seedling Processing, Storage, and Outplanting (expected 2000)

***Seeds of Woody Plants in the United States—Agriculture Handbook 450***

The much anticipated revised version of this out-of-print classic, renamed *Woody-Plant Seed Manual*, is expected out in 2000. This USDA Forest Service agricultural handbook is packed with information on all aspects of seeds from trees and shrubs grown throughout the U.S. Information on seed collection, handling, seeds per bushel, seeds per pound, presowing treatments, nursery cultural practices, etc. is given for most woody plants grown for conservation and reforestation purposes in the United States.

Available in the year 2000 from:

---

U.S. Government Printing Office  
Superintendent of Documents  
Mail Stop SSOP  
Washington, D.C. 20402-9328

**Complete citation:**

Schopmeyer, C.S. 1974. Seeds of Woody Plants in the United States. Agriculture Handbook 450. Washington, D.C.: USDA Forest Service. 883 p.

***Seeds of Woody Plants in North America***

This large-format hardbound book is an updated version of USDA Agricultural Handbook 450: *Seeds of Woody Plants in the United States* (described above). The main benefit of this new book is that many more plants have been added, although most of the new additions are relatively uncommon, introduced species. The authors also incorporated over 1,000 literature citations.

***Forest Nursery Manual***

Tom Landis is probably biased, but as National Nursery Specialist for the USDA Forest Service he thinks that this is one of the most comprehensive publications on the subject. It contains 30 chapters on the full range of subjects from site development, through cultural practices, to harvesting and storage. It's expensive but required reading if you plan to start a bareroot nursery business.

---

***Western Fertilizer Handbook***

The handbook has the following chapters: Soil—a Medium for Plant Growth; Water and Plant Growth; Principles of Plant Growth; Essential Plant Nutrients; Fertilizers—a Source of Plant Nutrients; Fertilizer Formulation, Storage and Handling; Correcting Problem Soils with Amendments; Soil Organic Matter; Soil and Tissue Testing; Methods of Applying Fertilizer; Growing Plants in Solution Culture; Benefits of Fertilizers to the Environment; Western Laws Relating to Fertilizing Materials; Amending the Physical Properties of Soils for Planting and Potting Purposes.

***Growing Conifer Seedlings, Transplants, and Trees in an Outdoor Nursery—Book One and Book Two.***

Both books are full of practical solutions and tips for growing bareroot seedlings. Written in 1992 by Donald B. Hilliker, Jr. and Joan M. Hilliker, owners of Treehaven Evergreen Nursery, both books, plus another entitled *Basics of Growing Christmas Trees*, can be obtained by writing them at:

Treehaven Evergreen Nursery  
981 Jamison Road  
Elma, NY 14059.
